

Stripe Removal Tractor Wheel #6673

**For use on lighter colors that have been
previously painted with a refinish clearcoat**

There is the possibility that the 6673 may “stain” the refinish clearcoat when removing a stripe, decal etc. due to the age (recently painted) or quality of the refinish clearcoat.

If the panel that you intend to use the 6673 on has been recently re-painted, or you question the paint quality, test the 6673 on an inconspicuous area before attempting use on the entire panel. If the “stain” can’t be removed use 9783/9784 Acry Solvent to remove the adhesive.

In most cases the effect is not permanent and can be removed in one of two methods:

1. If the panel is to be painted/blended sand the affected area with 1200 or 1500 grit to remove the “stain”.
2. If the panel is just going to have a new stripe or decal, apply polish to the affected area using 5361/5364 Cutting Compound with either a 5230 Acrylic Blend Pad or a 5260 Wool Pad.
